

# Claims

- [c1] A device that can be connected to any snowboard which includes a connecting component, a rotational component, and a handle component. Together, the device provides a handle connected to a snowboard whereby the handle can rotate vertically and horizontally, and further, whereby one skiing behind the snowboard and grasping the handle, applies force to the handle to control the direction, speed and edging of the snowboard.
- [c2] A device as defined in claim 1 that has a means of connecting to the surface of a snowboard, preferably using the existing snowboard binding screw holes.
- [c3] A device as defined in claim 1 that has the means to provide rotation of a handle both vertically and horizontally around one or more axes.
- [c4] A device as defined in claim 1 that has a handle with the means of detaching from and attaching to the rotational component, and thus the snowboard.
